

1. RA 10175, also known as the Cybercrime Prevention Act of 2012, is the main law in the Philippines aimed at addressing crimes that involve computer systems. It modernized the legal system to recognize digital crimes it protected citizens, businesses, and government against evolving cyber threats. And aligned the Philippines with global standards in fighting cybercrime . For me, it is still effective even in current times because it is continually being improved and enforced. And it is still recognized by main corporations, therefore it helps protect our country from criminal acts caused by computer devices, as our country is known worldwide for producing malware that spreads across the world, named as the I Love You virus.
2. Cross-border crime is challenging because cyber criminals can operate anywhere in the world, which has Different Legal systems, so what is considered illegal things they are doing in their country might not necessarily mean it is illegal in the country where they are operating. Law enforcement authority usually ends at national borders. So, local authorities' power is out of bounds when the case is traced back to other countries. To strengthen the fight against these issues, governments must head towards globalization with this in mind. Having more international organizations that fight against crimes like this. An international agency that is active in solving crimes like this may be beneficial for the whole world as we head towards advancing through technology.
